

# Hope Artificial Intelligence

## Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

**Ans:**

**I will achieve this by using the NLP because here the data set has text (employee name, job role), the requirement is clear and the inputs and output are well defined so can proceed with Supervised learning. While observing the output has categorical value.**

B) Find out the 3 -Stage of Problem Identification

**Ans:**

**S1: NLP**

**S2: Supervised Learning**

**S3: Classification**

C) Name the project

**Ans: Employee Resignation Prediction**

D) Create the dummy Dataset.

**Ans:**

| Employee name | Job role            | Resign             |
|---------------|---------------------|--------------------|
| Mano          | Front-end developer | Not resign         |
| Kamali        | Back-end developer  | Resign immediately |
| Praveena      | Ai developer        | Not resign         |
| Jimin         | Front-end developer | Not resign         |
| Suga          | Ai developer        | Resign immediately |
| Sanjay        | Back-end developer  | Not resign         |
