

Hope Artificial Intelligence

Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

Ans:

I will achieve this by using the ML because here the data set has numerical value. The requirement is clear and the inputs and output are well defined so can proceed with Supervised learning. While observing the output has Classification value.

B) Find out the 3 -Stage of Problem Identification

Ans:

S1: ML

S2: Supervised Learning

S3: Classification

C) Name the project

Ans: Employee Resignation Prediction

D) Create the dummy Dataset.

Ans:

Employee name	Employee ID	Employee Age	Resign
Mano	2564657	25	Not resign immediately
Kamali	2567889	24	Yes Resign immediately
Praveena	2900000	34	Not resign immediately
Jimin	2930450	30	Not resign immediately
Suga	2102030	32	Yes Resign immediately
